

CLAIM SECTION

0021 What I claim as my invention is this communications process/system—ICSS—that supports and commends real-time two-way audio/visual in areas such as facilitating contact between individuals (including compartment areas, vital or non-vital inner section(s) of a moving vehicle/craft, in transit or routed to its' destination) and third party individuals, place, thing, or other systems not onboard.

0022 ICSS allows both for general audio/visual communications as well as for high or low-level security surveillance purposes designated for civilian and commercial use. In addition, ICSS is applied to the concept of the possible “total connectivity” of everything and everybody; this is total connection of people/business to their property and each other. “Total connection” can be defined as “virtual” communication in real-time (i.e. audio/video); ability to give remote “command(s)” to objects to do or not to do a task (via voice or data entry i.e. touch-tone); and, the ability to capture, store, organize, and utilize this data for future usage.

0023 ICSS will combine/consolidate all modes of communication into one operative entity. This is the case because ICSS will facilitate all communication and contact possibilities by incorporating the best attributes of other forms of communication while creating new systems, tools, and processes to expand the scope and usefulness of this invention.
